

- Centrale monophasée pour 1 moteur 230 Vac.
- Portails coulissants, portes de garages, stores.
- 3 niveaux de ralentissement, apprentissage temps de travail automatique 4 modes de fonctionnement, récepteur radio intégré.

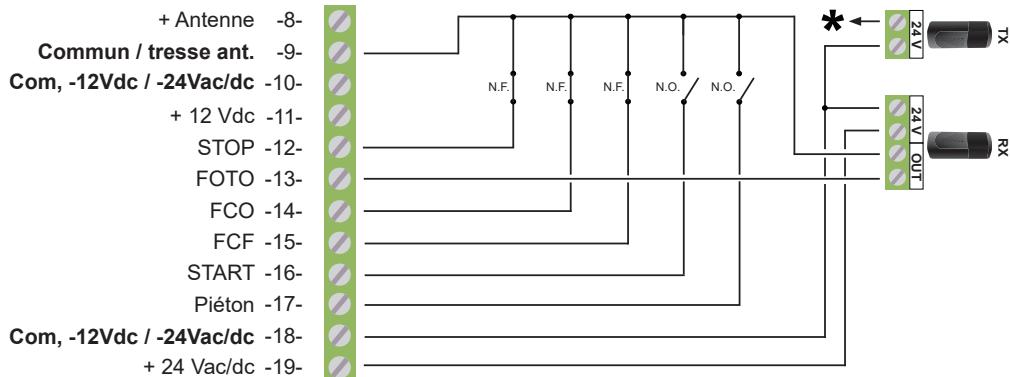

START-S3XL/2018

Récepteur Radio Intégré

Cellules activés seulement en ferme

Contact sec -20- Pour programmer le voyant fixe ou clignotant,
Contact sec -21- appuyer la touche P1 quand la porte ou le portail ferme.

Barre palpeuse -22-
Barre palpeuse -23-

Deactivation entrée
BARRE PALPEUSE

* Brancher ce point à la borne n° 21 pour le test des cellules.
Sinon le brancher à la borne n°19

Introduction

Ce manuel donne tous les informations spécifiques nécessaires pour la connaissance et l'utilisation de l'armoire. Il faut le lire avec attention et le consulter afin qu'il n'y ait pas de souci sur son utilisation ou quand on prévoit de faire de consultations futures. Le fabricant se réserve le droit d'y apporter toutes les modifications jugées nécessaires sans préavis de sa part.

Sécurité et protection du milieu

La directive européenne 2002/96/EC demande à ce que les platines ayant ce symbole sur le produit ou / et sur l'emballage ne doivent pas être jetées avec les ordures ménagères. Il est de la responsabilité du propriétaire de diriger les produits ou autres dispositifs électroniques vers des centres de traitement spécialisés pour ce type de déchet. Le fabricant n'est pas responsable pour des dommages dérivant d'une utilisation incorrecte ou une utilisation différente pour laquelle le produit a été conçu.

Symboles et instructions

Danger

Indique avertissement de sécurité et non observation provoque des dommages matériels !

Dispositif sous tension

1 Introduction

1.1 Précaution de sécurité

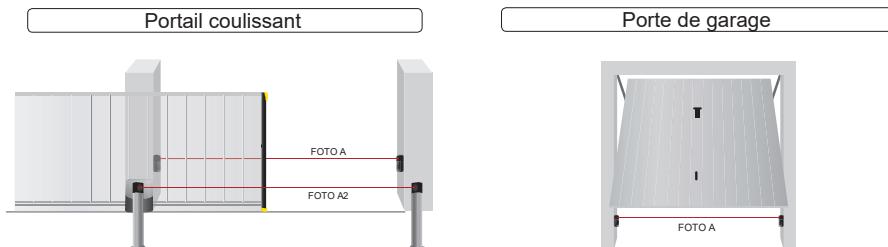

Le fabricant n'est pas responsable pour les dommages découlant d'une utilisation incorrecte ou une utilisation différente pour laquelle le produit a été conçu. Le fabricant n'est pas responsable des dommages occasionnés à l'exception de la responsabilité civile sur les produits. Toutes les installations de portails et portes automatiques doivent être installés par des professionnels qualifiés selon la norme. Avant de l'installer, vérifier la robustesse de la mécanique du portail ou de la porte, contrôler les butées mécaniques, quelles soient aptes pour arrêter en cas de panne de fin de course électriques ou de manœuvre manuelle.

1.2 Champs d'application

L'armoire électronique START-S3XL est destinée pour portails coulissants, porte de garage, stores et portes automatiques. Elle peut commander un moteur oléodynamique ou électromécanique sous 230Vac.

1.3 Système de sécurité

Il est important d'analyser les risques de la MACHINE et des requêtes du client pour établir le nombre des accessoires à installer. Dans le schéma les cellules **FOTO A** en ouverture n'ont aucun effet ,elle provoque un inversion pendant la fermeture. La **FOTO A2** est le branchement en série de **FOTO A** ou le branchement de ALT. Contrôler que les cellules soient bien synchronisées et protégées contre les interférences

Il est conseillé d'installer un interrupteur STOP pour le blocage immédiat de la porte. L'interrupteur doit être à contact normalement fermé qui s'ouvre comme indiqué sur le Par. 2.7

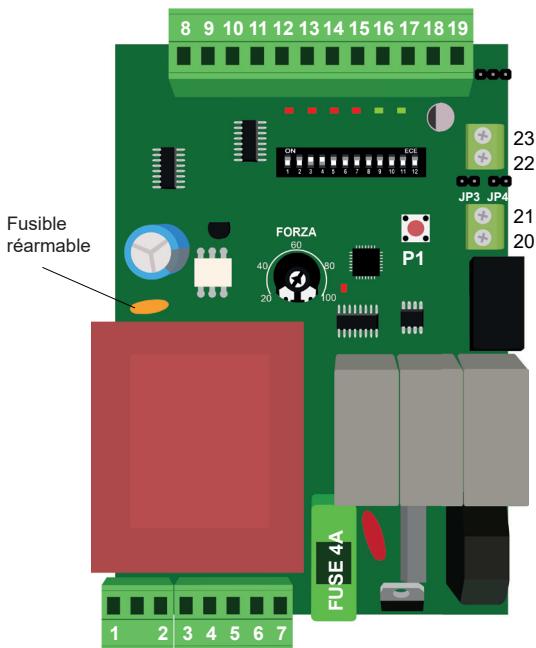

1.4 Caractéristiques techniques

Dimensions	87 x 126 x 40	mm
Poids	0.46	Kg
Puissance maximale du moteur	1 750 4	HP W A
Puissance maximale de la lampe	40	W
Courant maximal du contact sec	2	A
Courant maximal sous 24 Vac/dc	300	mA
Courant maximal sous 12 Vdc	50	mA

2 Installation de l'armoire

2.1 Schéma de l'armoire et branchements électriques

1 → 2 Alimentation de l'armoire en 230Vac

3 → 7 Alimentation moteur 230Vac et lampe à 230Vac.

8 → 19 Tension d'alimentation des accessoires et entrée services et sécurité.

20 → 21 Contact "sec" pour voyant ou TEST cellule ou lampe sans clignotement

22 → 23 Entrée barre palpeuse Alt + inversion pour 1,5 s

JUMPER AC/DC Sélectionne l'alimentation sortie 24Vac/dc

JP3 - JP4 Barre Palpeuse

DIP 1-10 Choix des fonctions de l'armoire.

DIP 11-12 Choix des vitesses de ralenti ou exclusion du ralenti

Pulsante P Gestion code radio, réglage de la force, augmentation temps de pause.

Branchemet de la tension de reseau

La ligne d'alimentation de l'armoire doit être protégé par un interrupteur magnétothermique ou un couple de fuses de 5A. Un interrupteur différentiel est conseillé si est déjà disponibles sur l'installation.

Branchemet MOTEUR

Il faut faire attention a non invertir le pôles OUVRE et FERME

En cas de souci sur le branchement il faut positionner manuellement le portail à mi-course. Et se tenir prêt pour arrêter l'installation sur STOP! Pour être sûre que OUVRE effectivement il faut interrompre les cellules: si le portail ferme, ça veut dire que le branchement n'est pas correct et il faut inverser les câbles OUVRE et FERME du moteur.

2.2 Description des branchements électriques

230 Vac	1		Alimentation électrique 230 Vac 50 Hz
			
230 Vac	2		Alimentation électrique 230 Vac 50 Hz

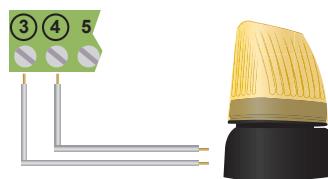

Clignotant	3		Sortie pour clignotant ou lampe de courtoise 230 Vac, max puissance de la lampe 40 ou 100W.
	4		
MOT Commun	5		Sortie pour branchement moteur pôle COMMUN
MOT Fermeture	6		Sortie pour branchement moteur pôle FERMETURE
MOT Ouverture	7		Sortie pour branchement moteur pôle OUVERTURE

Antenne	8		Entrée signal de l'antenne (âme de l'antenne)
Commun	9		Commun pour toutes les entrées services, sécurités, câble coaxial de l'antenne.
Com, -12Vdc / -24Vac/dc	10		Sortie -12/24Vdc (négatif) / Commun (voir Par. 2.6)
+ 12Vdc	11		Sortie +12 Vdc (positif) (voir Par. 2.6)
Stop	12		Entrée STOP
Foto	13		Entrée photocellule PHOTO (la sécurité PHOTO fonctionne seulement en fermeture)
Fco	14		Entrée fin de course Ouverture
Fcf	15		Entrée fin de course Fermeture
Start	16		Entrée commande PAS à PAS Ouverture totale (réglable par DIP 2 et DIP 3)
Piéton	17		Entrée commande PAS AU PAS ouverture partielle (PIETON) (idem à START)
Com, -12Vdc / -24Vac/dc	18		Sortie -12Vdc / - 24Vac/dc (voir Par. 2.6)
+24Vdc / 24Vac	19		Sortie + 24Vdc ou 24Vac (voir Par. 2.6)

C. Spia	20		Contact "sec" pour voyant ou TEST photocellule
C. Spia	21		Ou lampe sans clignotement interne.

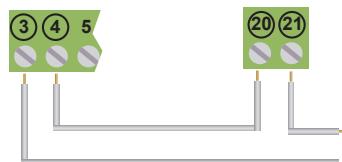

Alt	22		Entrée barre palpeuse alt + inversion pendant 1,5 Sec
Alt	23		Entrée barre palpeuse alt + inversion pendant 1,5 Sec

2.3 Branchement de la LAMPE 230 Vac

Lampe dotée du clignotement

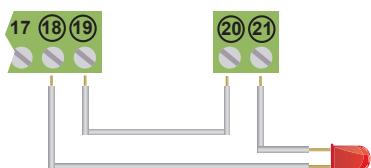

DIP 4 - ON
ON
1 2 3 4 5

Lampe sans clignotement

! Si on utilise le test des cellules,
ou un voyant en 24V, on ne peut
pas utiliser ce branchement.

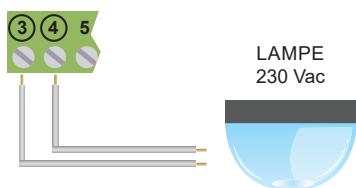

2.4 Branchement d'un voyant 24V portail ouvert et en marche

! Si on utilise le test des cellules,
ou un voyant en 24V, on ne peut pas utiliser ce TYPE de
branchement.

ON
1 2 3 4 5 6 7 8 9 10 CTS DIP 10
ON Voyant fixe

2.5 Branchement lumière de courtoise

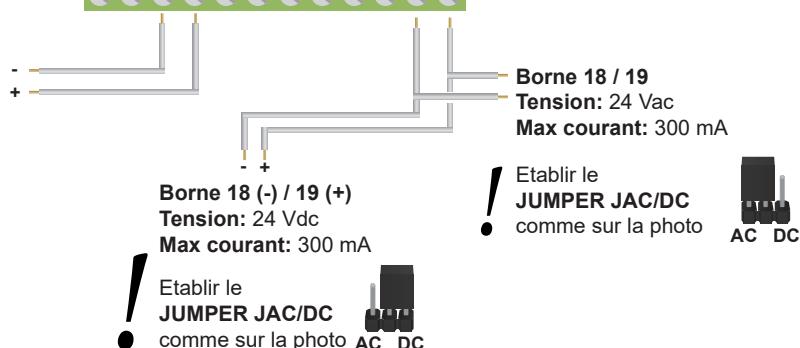

DIP 4 - OFF
ON
1 2 3 4 5 6 7 8 9 10 CTS

2.6 Alimentation des ACCESSOIRES

8 9 10 11 12 13 14 15 16 17 18 19

Borne 10 (-) / 11 (+)
Tension: 12 Vdc
Max courant: 50 mA

Borne 18 / 19
Tension: 24 Vac
Max courant: 300 mA

JUMPER JAC/DC
comme sur la photo

! Etablir le
JUMPER JAC/DC
comme sur la photo

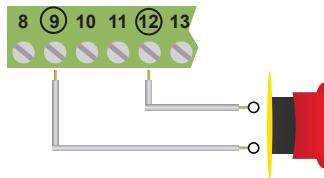

2.7 Branchement COMMANDE STOP et BARRE PALPEUSE

Branchement du commande STOP

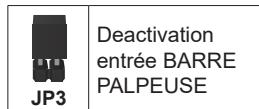

Touche: arrête et interdit jusqu'à une nouvelle commande.

Interrupteur: Le portail est bloqué jusqu'à le rétablissement du même interrupteur.

Branchement du BARRE PALPEUSE:

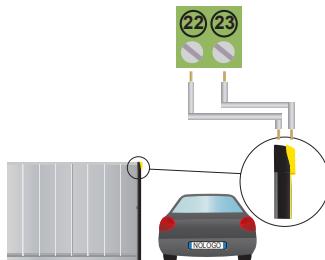

Arrête la porte et renverse pour 1.5 seconds

Contact Barre palpeuse de sécurité (mors. 22-23)

	Contact N.F. (Normalement fermé)		Contact 8K2
--	-------------------------------------	--	-------------

Si pendant le clignote du LED L1, le voyant n'éteint pas complètement, ça signifie que l'entrée **BARRE PALPEUSE** est en pause ou interdit.

Le branchement des dispositifs des sécurités prévoit l'usage de n'importe quel bouton ou un contact N.F.
Plusieurs dispositifs seront branchés en parallèle

2.8 Branchement FIN de COURSE

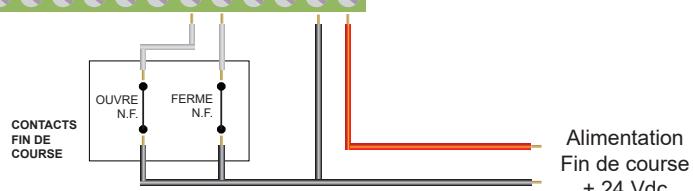

Sur la photo est montré le branchement des deux fins de course mais sur cette armoire on peut les utiliser séparément.

Les contacts des fins de course doivent être N.F.
(Normalement fermé)

! Si les entrées FCO ou FCF n'est pas utilisée,
placer ON DIP 7 pour FCO
placer ON DIP 8 pour FCF

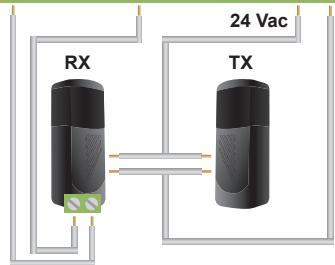

2.9 Branchement des fins de course magnétiques

JUMPER AC/DC
Placer le pontet sur DC

2.10 Branchement PHOTOCELLULE 24 Vac (seulement en fermeture) 24 Vac

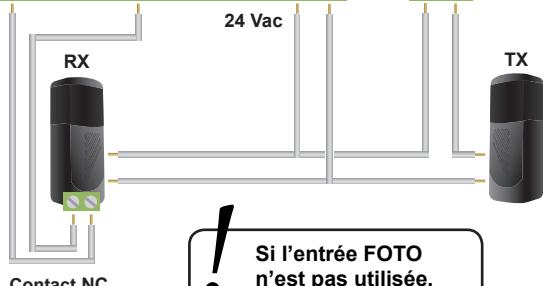

Sans TEST

Avec TEST

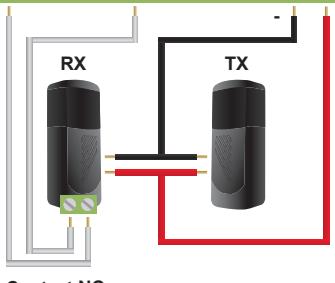

Etablir le
JUMPER
JAC/DC
comme sur
la photo

2.11 Branchement PHOTOCELLULE 24 Vdc

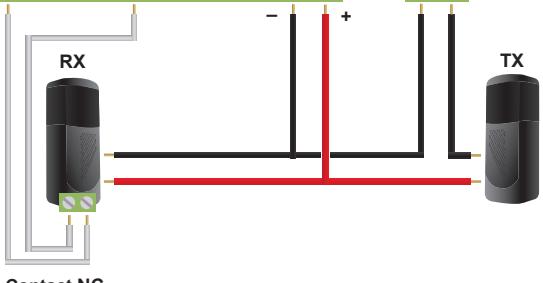

Sans TEST

Avec TEST

Etablir le
JUMPER
JAC/DC
comme sur
la photo

Le TEST des cellules assure le fonctionnement du portail seulement si les cellules marchent correctement. L' armoire fait un test avant chaque ouverture. Dans le cas les cellules ne marchent pas correctement, la lampe s'allume pour 5 seconds et le portail ne marche pas. Le test est automatiquement activé par l' armoire après l'apprentissage des temps de travail avec le commande START. Si on veut retourner au fonctionnement le voyant des borniers 20 et 21, il faut brancher les cellules sans test et répéter l'apprentissage des temps avec le commande START.

Le fonctionnement TEST est compatible avec plus appareils plus lents (par ex. RADIOBAND), si ces appareils sont disponibles l'ouverture est retardée de quelque second. On peut tester les appareils branchés aussi sur l'entrée STOP et BARRE PALPEUSE.

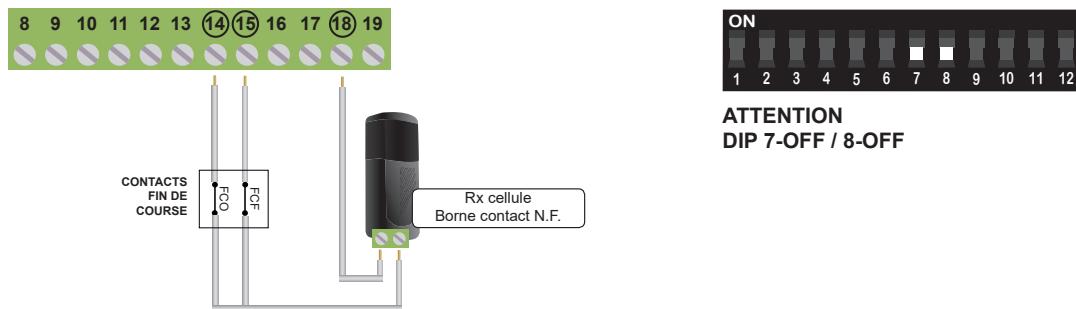

Quand les branchements sont terminés en TEST il faut mémoriser les temps pour le commande START et l' armoire releve automatiquement les entrées branchées aux dispositifs sous TEST.

Le contact du récepteur doit être:

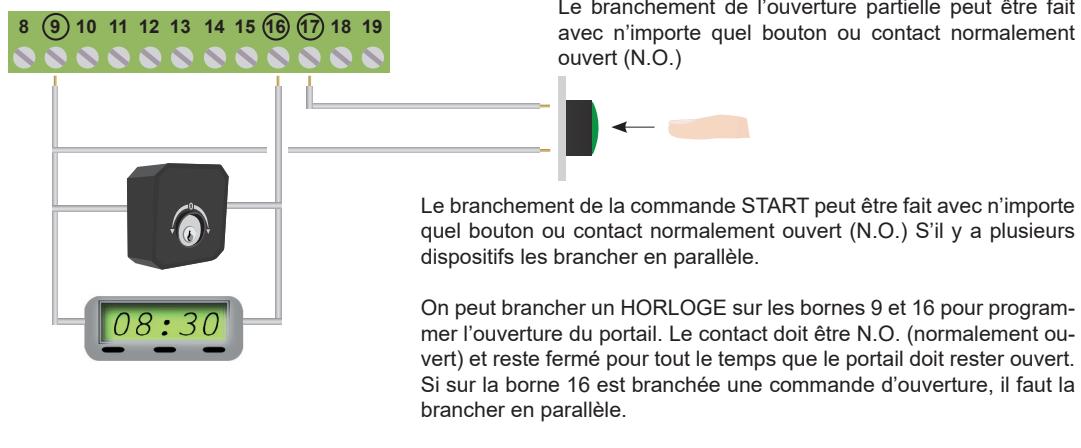

- sec sans tension
- N.C. (N.F.)
(Normalement fermé).

Si on utilise plusieurs paires des cellules les brancher en série

2.12 Branchement des CELLULES B (ouvre et ferme)

2.13 Branchement des commandes “START” et “PIETON”

2.14 Contrôle des branchements

Le voyant led L1 indique le bon fonctionnement de la logique de l'armoire. Il doit clignoter toutes les secondes, indiquant que le micro est actif, en attente de commande.

Quand l'armoire est alimentée, les LED sont allumées quand un contact est fermé avec le commun.

Normalement les LED rouges des entrées **STOP - FOTO - FCO - FCF - ALT BARRE PALPEUSE** sont allumées. Normalement les voyants verts des entrées **START - PIETON** sont éteintes

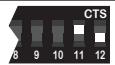

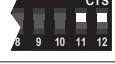

3 Modes de fonctionnement et réglages

	2-ON 3-OFF	copropriété	N'accepte aucune commande en fermeture et en pause. Referme automatiquement après le temps de pause
	2-OFF 3-ON	semi automatique	A chaque commande ouvre-stop-ferme-etc... Pas de fermeture automatique.
	2-OFF 3-OFF	automatique 1	A chaque commande inverse: ouvre-ferme . La fermeture auto se fera après le temps de pause
	2-ON 3-ON	automatique 2	A chaque commande ouvre - stop - ferme - stop - ouvre - etc... Referme automatiquement à la fin du temps de pause.
	3-OFF	referme a REAPPARITION DU COURANT	L'armoire fait un cycle complet d'ouverture et de fermeture et seulement à la réapparition du réseau referme le portail.
	4-ON	Clignotant même en pause	Pour activer la fonction suivre les instructions dans l'apprentissage des temps de travail. (par. 5.1 ali. 4). Sur les bornes 3 et 4 la sortie est active seulement quand le moteur marche ou quand le portail est en pause.
	4-OFF	Lumière de Courtoisie	Sur les bornes 3 et 4 la sortie est active du début de l'ouverture jusqu'à deux minutes après la fermeture. Utile pour alimenter la lumière de courtoisie.

Exclusion entrée STOP-FOTO-FCO-FCF des DIP 5-6-7-8

	5-ON	Exclusion entrée STOP		7-ON	Exclusion entrée FCA
	6-ON	Exclusion entrée FOTO		8-ON	Exclusion entrée FCC
	9-ON	Pas de préavis	Désactivation du préavis et augmentation de la vitesse des inversions		
	10-ON	Activation Frein interieur	Le frein intérieur peut être activé par l'intervention du fin de course		

Vitesse de ralentissement des DIP 11-12

	11-OFF 12-OFF	Très ralenti	C'est le ralentissement plus lent et indiqué pour la plupart des automatismes. Si on utilise des moteurs oléodynamiques il faut utiliser une vitesse plus haute.
	11-ON 12-OFF	Ralenti Moyen	Vitesse de ralentissement moyenne
	11-OFF 12-ON	Un peu ralenti	Vitesse de ralentissement haute
	11-ON 12-ON	Pas de ralenti	Exclusion du ralentissement

4 Gestion DES EMETTEURS

La carte électronique peut gérer plusieurs types de codes. Le premier émetteur appris indique le type de code en gestion. On ne peut mémoriser un type de code différent du premier. On peut gérer des codes de 12 à 64 bits et pour le Rolling-code HCS®, on peut gérer seulement la partie fixe du code. Les émetteurs Rolling code ne peuvent pas être copiés. La capacité de mémorisation est de 200 codes différents. Le premier émetteur appris indique le type de code en gestion.

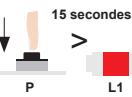

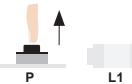

ACTIVATION/DÉSACTIVATION DU CONTRÔLE ROLLING-CODE COMPLET.

IL FAUT PRESSER LA TOUCHE QUAND ON EST EN FONCTION PIETON.

LE VOYANT L1 ROLLING CODE CLIGNOTE UNE FOIS ET DEUX AVEC ROLLING CODE COMPLET.

4.1 EFFACEMENT complet de l'armoire

Cette opération est possible quand tous les codes sont déjà mémorisés. On ne peut pas effacer un seul code mémorisé. Il faut effacer la mémoire avant de mémoriser le premier émetteur ainsi d'éviter d'utiliser des codes qui ne sont pas utilisés. L'effacement de la mémoire est possible seulement lorsque le portail est fermé.

1		Il faut s'assurer que l'interrupteur DIP1 soit sur OFF . Le portail est fermé
2		Il faut maintenir appuyé la touche P sur la carte pendant 15 secondes. Le voyant L1 et les voyants verts START et PED s'allument et L1 clignote.
3		Passées les 15 secondes et relâcher la touche P sur la carte. Attendre que le voyant L1 clignote normalement

4.2 APPRENTISSAGE des émetteurs

L'apprentissage des codes est possible seulement quand le portail est FERME

! Pendant la mémorisation des codes on conseil d'enlever temporairement le câble de l'antenne aux bornes 8-9.

1	 1 2 3 4 5	Il faut s'assurer que le DIP1 soit sur OFF . Le portail est fermé
2		Presser une fois la touche P sur la carte. Le voyant L1 reste allumé et attend pour 10 secondes une commande
3		Appuyer et relâcher la touche de l'émetteur pour faire la commande START. L1 clignote 6 fois rapidement puis lentement et reste allumée pour 10 secondes (CODE START APPRIS)
4		Presser 2 fois la touche P et relâcher lentement la touche de l'émetteur qui doit commander le piéton (le second canal). La L1 clignote 6 fois rapidement puis normalement.

- Si on veut enregistrer un nouvel émetteur il faut réitérer l'opération depuis le début.
- Si on ne veut pas plus associer aucune touche à la commande PIETON il faut passer le passage 4 et attendre 8 secondes et **L1** clignotera une fois pour retourner au clignotement normal (sortie de l'apprentissage du code).
- Si quand on touche l'émetteur **L1** reste allumé, ça signifie que l'émetteur n'est pas compatible.
- Si quand on touche un émetteur **L1** clignote lentement ça signifie que la mémoire est pleine.
- L'effacement d'un seul code n'est pas possible.

5 Allumage et programmation

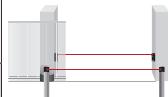

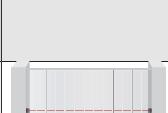

A la mise sous tension de la carte électronique, si tout est bien branché **L1**(rouge) les voyants, **STOP, FOTO, FCA, FCC, ALT COSTA** doivent être allumés (si le portail est fermé, **FCC** est éteint). Les voyants **START** et **PED** doivent être éteints.Si après l'allumage le moteur ouvre, ça signifie que l'armoire électrique a été privée de courant précédemment (alimentation retirée) quand le portail a été ouvert.

! Si on n'a pas encore établi les temps de travail il faut, Eteindre la carte, fermer le portail, placer le DIP1 sur ON et alimenter une nouvelle fois. Placer le DIP1 sur ON, la carte électronique est prête pour l'apprentissage des temps: temps du travail et pause du moteur, position de ralentissement en fermeture, activation ou désactivation du clignotant en pause.

Pour cette opération il faut utiliser les commandes **START** et **PIETON**. Les commandes peuvent être utilisées avec un dispositif branché sur les bornes 9 -17 pour l'ouverture PIETONNE (voir BRANCHEMENT COMMANDE D'OUVERTURE et " BRANCHEMENT COMMANDE PIETON) ou avec un émetteur déjà mémorisé (voir MEMORISATION EMETTEURS)

! Cette opération est possible quand le portail est fermé.
Placer sur ON le DIP1 avant d'alimenter la platine

5.1 Apprentissage temps de travail avec COMMANDE OUVERTURE “START”

1		Couper l'alimentation de la centrale Placer DIP 1 sur ON	Le portail est FERME
2		Alimenter la centrale. (Le voyant LED1 est éteint)	
3		Appuyer sur START (ou autre commande sur l'entrée 16 ou 1er bouton de l'émetteur compatible)	Le portail s'ouvre
4		Si on veut activer le clignotant pendant la pause, faire une commande PIETON pendant l'ouverture (entrée 17 ou 2ème bouton de l'émetteur compatible) Sinon lire le point 5A	ACTIVATION CLIGNOTANT EN PAUSE
5A		S'il n'y a pas le fin de course ouverture, attendre que le portail arrive sur la butée mécanique, et appuyer sur la commande START	Le portail s'arrête
5B		Si le fin de course ouverture est branché, le portail s'arrêtera sur celui ci et donnera le point d'arrêt en ouverture.	
6		Laisser passer le temps pour lequel le portail doit rester ouvert.	Le portail est en pause
7		Appuyer sur START pour commencer la fermeture	Le portail se ferme
8A		Portail coulissant, appuyer sur START pour définir la zone de ralentissement avant l'arrêt sur le fin de course.	Le portail ralenti
8B		Sur la porte de garage sans fin de course fermeture, cela donnera le point où la porte commence à ralentir.	
8C		Sur la porte de garage avec fin de course fermeture, le ralentissement se fera pendant 2" après l'intervention du fin de course fermeture.	
9		Attendre que le portail s'arrête automatiquement sur le fin de course	Le portail est fermé
10		Remettre le DIP 1 sur OFF pour retourner au fonctionnement normal. Le clignotant s'éteint et la LED 1 recommence à clignoter normalement.	Programmation terminée

Si on a bien fait l'apprentissage des temps avec la commande START, le moteur ralenti 2 secondes avant l'arrivée du portail et ralenti en fermeture à l'endroit choisi ou à l'intervention du fin de course (voir passage 8/AB/C tableau chapitre 5.1)

5.2 Apprentissage temps de travail avec COMMANDE PIETON

La commande PIETON est utilisée pour l'ouverture partielle pour le passage des personnes ou des petits moyens de transport afin d'éviter l'ouverture complète du portail.

Le portail ralenti seulement à la fermeture comme dans la programmation avec la commande START.

1		Couper l'alimentation de la centrale Placer DIP 1 sur ON	Le portail est fermé
2		Alimenter la centrale. (Le voyant LED1 est éteint)	Le portail est fermé
3		Faire une commande PIETON (cablé sur la borne 17 ou 2ème canal de l'émetteur compatible)	Le portail ouvre
4		Faire une commande PIETON pour arrêter le portail à l'endroit choisi	Le portail s'arrête
5		Laisser passer le temps durant lequel le portail doit être rester ouvert.	Le portail est en pause
6		Faire une commande PIETON pour commencer la fermeture	Le portail ferme
7		Attendre que le portail s'arrête automatiquement.	Le portail est fermé
8		Placer l'interrupteur DIP 1 sur ON pour retourner au mode normal. Le clignotant s'éteint et le voyant L1 recommence à clignoter normalement.	Programmation terminée

5.3 REGLAGE de la force du moteur

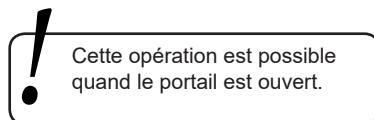

Reglage de la force du moteur
de 20% à 100%

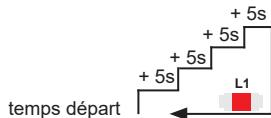

L'armoire a un décollage automatique. La force est donnée au maximum au départ du moteur pendant 2 secondes.

5.4 Augmenter le temp de Pause

Il est possible d'augmenter le temps de pause sans répéter l'apprentissage des temps de travail. Quand le portail est fermé en pause, chaque pression sur P, fait augmenter le temps de pause de 5 seconds Il y a 4 niveaux différents. A la 5ème pression ,le temps de pause retourne comme au début. (L'allumage du voyant L1 est prolongé) Il est possible d'augmenter le temps de pause jusqu'à 20 secondes. (4 pressions x 5 secondes). Si 20 secondes ne sont pas suffisantes on peut augmenter le temps de pause si on fait un autre cycle d'ouverture

Changement du temps de pause à chaque pression

5.5 Retour aux paramètres d'usine

Il est prévu de remettre à zéro les paramètres d'usine en suivant la procédure qui suit:

1		Placer DIP 1 sur ON
2		Mantenir appuyé la touche P jusqu'à ce que le voyant clignote rapidement
3		Placer DIP 1 sur OFF

6 Solutions aux problèmes

PROBLÈME: la carte électronique ne marche pas (le voyant TEST ne clignote pas).

SOLUTION: enlever le bornier, contrôler les fusibles à 4 Ampères, redonner alimentation. Si la platine marche il faut contrôler les branchements des accessoires et ça indique que le fusible réarmable F3 a activé la protection.

PROBLEME:

Le fusible 4A est brûlé

SOLUTION: contrôler le moteur, le clignotant ou la lumière de courtoise.

PROBLEME:

Le moteur s'arrête 2 secondes après avoir démarré

SOLUTION: Augmenter la force du moteur (voir chap.5.3) et exclure les ralentissements.

PROBLEME:

Avec les ralentissements, l'automatisme n'atteint pas la butée.

SOLUTION: essayer d'augmenter la vitesse de ralentissement avec le DIP 11-12

PROBLEME:

LA CARTE Électronique ne fait pas l'ouverture

SOLUTION: contrôler l'état des voyants rouges. Ils doivent s'allumer. Si on utilise les fins de course, le voyant du fin de course fermeture est éteint si le portail est fermé. Les voyants verts sont normalement éteints. Si l'entrée BARRE PALPEUSE n'est pas utilisée, il faut faire un pont entre les bornes 22-23 :

PROBLEME:

La carte électronique fonctionne de manière bizarre.

SOLUTION: s'assurer que les branchements des services ne soient pas branchés sur un pôle des tensions d'alimentation. **IMPORTANT:** Si on branche les cellules avec 3 fils il faut utiliser l'alimentation en 12Vdc disponible sur les bornes 10 et 11. (Voir chap. 2.6)

7 Declaration de Conformité

(selon la directive 2006/42/CE, Attachée II, partie B)

Le sous-signé Ernestino Bandera
Administrateur

Déclare que:

Société: EB TECHNOLOGY SRL
Adresse: Corso Sempione 172/5
21052 Busto Arsizio VA Italy
Nom du produit: START-S3XL/2018
Armoire électronique
pour 1 moteur en 230 Vac

LE PRODUIT EST CONFORME	
Selon la directive communautaire	
2006/42/CE	
DIRECTIVE 2006/42/CE DU PARLEMENT EUROPEEN DU CONSEIL du 17 mai 2006 concernant le rapprochement des lois des Etats membres concernant les machines.	
Référence: Attachée II, part B (déclaration CE de conformité du fabricant).	
LE PRODUIT EST CONFORME	
Selon la directive communautaire , ainsi comme changée de la directive 2006/42/CE:	
2014/35/CE	
DIRECTIVE 2014/35/UE DU PARLEMENT EUROPÉEN ET DU CONSEIL du 26 février 2014 relative à l'harmonisation des législations des Etats membres concernant la mise à disposition sur le marché du matériel électrique destiné à être employé dans certaines limites de tension (refonte)

Company:	DIRECTIVE 2006/42/EC ISSUED BY THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2006/42/EC	DIRECTIVE 2014/35/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/30/EU	Reference to harmonized standards: EN 60335-1 Council Directive 2014/30/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/53/CE	THE PRODUCT COMPLETES what is outlined in the European Community directive: with the essential requirements of Article 3 of the following European Directive until the machine, for which the product is intended, is not yet type- or design-harmonized, for the use of article 3 of the following European Directive in accordance to the marking available of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/53/CE	DIRECTIVE 2014/53/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 16 April 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/30/EU	Reference to harmonized standards: EN 60060-6-2 DIRECTIVE 2014/30/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/30/EU	Reference to harmonized standards: EN 61000-6-3 DIRECTIVE 2001/80/EC OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 20 July 2001 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/30/EU	Reference to harmonized standards: EN 61000-6-6-3 DIRECTIVE 2014/30/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/30/EU	Reference to harmonized standards: EN 61000-6-6-3 DIRECTIVE 2014/30/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/35/CE	THE PRODUCT COMPLETES what is outlined in the European Community directive: with the essential requirements of Article 3 of the following European Directive until the machine, for which the product is intended, is not yet type- or design-harmonized, for the use of article 3 of the following European Directive in accordance to the marking available of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/35/CE	DIRECTIVE 2014/35/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/35/CE	Reference to harmonized standards: EN 60335-1 DIRECTIVE 2014/35/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/35/CE	Reference to harmonized standards: EN 60335-1 DIRECTIVE 2014/35/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/35/CE	Reference to harmonized standards: EN 60335-1 DIRECTIVE 2014/35/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.
2014/35/CE	Reference to harmonized standards: EN 60335-1 DIRECTIVE 2014/35/EU OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of 26 February 2014 on the harmonisation of the laws of the Member States relating to the marking and Declaration of Conformity of electrical equipment designed for use within certain voltage limits.

CE

DECLARERES THAT:

Administrative area

The undersigned Ernestino Bandera,

7 Declaration of CE conformity

(according to EC Directive 2006/42, Annex I, part 1, sect. A)

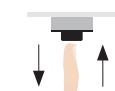

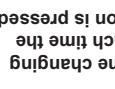

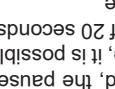

PROBLEM:	The control panel doesn't open	SOLUTION: The control panel must be lit on. All red led have to be turned off. If you don't use the input for safety edge, make a link between 22 and 23.
PROBLEM:	The control panel works incorrectly	SOLUTION: Check all red led. All must be lit on. If you use LS, LSC is turned on while the gate is closing. The green led have to be turned off. If you don't use the input for safety edge, make a link between 22 and 23.
PROBLEM:	The control panel doesn't reach the stroke.	SOLUTION: If you use the slowing down, the gate doesn't reach the stroke.
PROBLEM:	If you use the slowing down, the gate doesn't reach the stroke.	SOLUTION: If you use the slowing down, the gate doesn't reach the stroke.
PROBLEM:	The pause time is burnt out.	SOLUTION: Try to increase the speed of slowing down with dip switches 11 and 12.
PROBLEM:	The electronic circuit board does not work (the TEST signal light does not flash).	SOLUTION: Try to increase the speed of slowing down with dip switches 11 and 12.
PROBLEM:	Check the 4A fuse.	SOLUTION: The 4A fuse is burnt out.
PROBLEM:	Check the courtesy light.	SOLUTION: Try to deactivate the motor force (see chap. 5.3) and deactivate the slowing down.
PROBLEM:	The motor stops or nearly stops after a few seconds.	SOLUTION: The motor stops or nearly stops after a few seconds.
PROBLEM:	The gate doesn't reach the stroke.	SOLUTION: Check the connection for power supply, MPROTANT: if you use the 3 wire connection for power, it is recommended to power the 3 wires to one pole of the power supply.
PROBLEM:	The gate reaches the stroke but doesn't stop.	SOLUTION: If you use the slowing down, the gate reaches the stroke but doesn't stop.

6 Problem solutions

1	Put DIP1 in ON	
2	Keep pressed the button P until the LED is flashing longer	
3	Bring DIP 1 in OFF position again	

You can reset the control panel at factory's settings:

5.5 RESET at FACTORY SETTINGS

	button is pressed	increasing the pause time by performing another opening cycle.
	each time the button is changed	when the automation is in pause mode during opening
	initial time	The operation can only be performed when the automation is in pause mode during opening

5.4 Increasing the PAUSE time

5.2 Times learning with the "PEDESTRIAN" COMMAND

The PEDESTRIAN command is used to open the automation only partially to allow people and small vehicles to pass through without having to open the gate completely. When opening is performed with this command, the automation decelerates only when it is closing and following the setting previously acquired in the START board keeps the motor force for 2 seconds maximum each time the motor starts up, the electronic circuit is running. This control unit has AUTOMATIC START. The operation can only be performed while the motor is running.

5.3 ADJUSTMENT of the MOTOR FORCE	
1	Switch off the power supply Set switch DIP 1 to ON The automation is in the CLOSED position Give power supply to the control panel. (The LED L1 light is off when the control unit is in programming mode)
2	Switch off the power supply Set switch DIP 1 to ON The automation starts in OPENING mode Press the PEDESTRIAN command (everything connected to input 17 or the 2nd channel of the comparable remote control that has been learned)
3	Switch off the power supply Set switch DIP 1 to ON The automation starts in OPENING mode Press the PEDESTRIAN command (everything connected to input 17 or the 2nd channel of the comparable remote control that has been learned)
4	Switch off the power supply Set switch DIP 1 to ON The automation is in the CLOSED position Press the PEDESTRIAN command to stop the automation at the desired point (end of partial opening). The automation STOPS
5	Switch off the power supply Set switch DIP 1 to ON This is the automation "PAUSE TIME". Let the time elapse during which the automation must remain open.
6	Press PEDESTRIAN command to start closing The automation starts in CLOSING mode Wait for the automation to stop automatically
7	Set the switch DIP 1 to OFF to return to normal operation. The automation is in the CLOSED position Wait for the automation to stop automatically
8	Set the switch DIP 1 to ON Time programming goes back on. The automation starts in CLOSING mode Wait for the automation to stop automatically

The operation can only be performed while the motor is running. This control unit has AUTOMATIC START. Each time the motor starts up, the electronic circuit is running. This control unit has AUTOMATIC START. The board keeps the motor force for 2 seconds maximum each time the motor starts up, the electronic circuit is running. This control unit has AUTOMATIC START.

Adjusts of the force of the motor from 20% up to 100%

If the times learning procedure with the START command has been performed correctly, the automation decelerates approximately 2 sec before reaching the full opening stroke while, in closing mode, it decelerates from the selected point or after the "limit switch close" cuts in (see step 8 a/b/c in the table in chapter 5.1).

1	 Turn off the circuit board is in the CLOSED position.	Set switch DIP 1 to ON The automation	LED L1 is turned on when the control panel is programming	Power the control unit:	LED L1 is turned on when the control panel is programming	Press START (everything connected to input 16 or the 1st channel of the compatible remote control that has been learned)	If you wish to activate the signal light in PAUSE : when the gate is opening, give a pedestal command (output no. 17 or 2nd channel of the remote control) otherwise read step no. 5A	ACTIVATING the FLASHING LIGHT in PAUSE MODE	This is the automation starts OPENING	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	The automation starts in CLOSING mode	On SLIDING, press START to define the point in which the automation is to slow down	For roll-up doors without LSC, press START to define the slowing down point.	The automation is in SLOW DOWN	Wait for the automation to stop automatically	Set the switch DIP1 to OFF to return to standard mode,		Time programming has been completed	10
2	 LED L1	Set switch DIP 1 to ON The automation	LED L1 is turned on when the control panel is programming	Power the control unit:	LED L1 is turned on when the control panel is programming	Press START (everything connected to input 16 or the 1st channel of the compatible remote control that has been learned)	If you wish to activate the signal light in PAUSE : when the gate is opening, give a pedestal command (output no. 17 or 2nd channel of the remote control) otherwise read step no. 5A	ACTIVATING the FLASHING LIGHT in PAUSE MODE	This is the automation starts OPENING	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	The automation starts in CLOSING mode	On SLIDING, press START to define the point in which the automation is to slow down	For roll-up doors without LSC, press START to define the slowing down point.	The automation is in SLOW DOWN	Wait for the automation to stop automatically	Set the switch DIP1 to OFF to return to standard mode,		Time programming has been completed	9
3	 The automation	starts OPENING	Press START (everything connected to input 16 or the 1st channel of the compatible remote control that has been learned)	If LSO is not available, when the gate is at the end of the stroke,	Press START	If the limit switch is connected you do not need to do anything because the limit switch itself gives the programming input	Let the time elapse during which the automation must remain open "PAUSE TIME"	This is the automation starts CLOSING	Press START to start closing	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	The automation starts in CLOSING mode	On SLIDING, press START to define the point in which the automation is to slow down	For roll-up doors without LSC, press START to define the slowing down point.	The automation is in SLOW DOWN	Wait for the automation to stop automatically	Set the switch DIP1 to OFF to return to standard mode,		Time programming has been completed	8C
4	 The automation	starts PAUSE	Press START	If LSO is not available, when the gate is at the end of the stroke,	Press START	If the limit switch is connected you do not need to do anything because the limit switch itself gives the programming input	Let the time elapse during which the automation must remain open "PAUSE TIME"	This is the automation starts CLOSING	Press START to start closing	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	The automation starts in CLOSING mode	On SLIDING, press START to define the point in which the automation is to slow down	For roll-up doors without LSC, press START to define the slowing down point.	The automation is in SLOW DOWN	Wait for the automation to stop automatically	Set the switch DIP1 to OFF to return to standard mode,		Time programming has been completed	8B
5A	 The automation	starts STOP	Press START	If LSO is not available, when the gate is at the end of the stroke,	Press START	If the limit switch is connected you do not need to do anything because the limit switch itself gives the programming input	Let the time elapse during which the automation must remain open "PAUSE TIME"	This is the automation starts CLOSING	Press START to start closing	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	The automation starts in CLOSING mode	On SLIDING, press START to define the point in which the automation is to slow down	For roll-up doors without LSC, press START to define the slowing down point.	The automation is in SLOW DOWN	Wait for the automation to stop automatically	Set the switch DIP1 to OFF to return to standard mode,		Time programming has been completed	8A
5B	 The automation	starts STOP	Press START	If LSO is not available, when the gate is at the end of the stroke,	Press START	If the limit switch is connected you do not need to do anything because the limit switch itself gives the programming input	Let the time elapse during which the automation must remain open "PAUSE TIME"	This is the automation starts CLOSING	Press START to start closing	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	The automation starts in CLOSING mode	On SLIDING, press START to define the point in which the automation is to slow down	For roll-up doors without LSC, press START to define the slowing down point.	The automation is in SLOW DOWN	Wait for the automation to stop automatically	Set the switch DIP1 to OFF to return to standard mode,		Time programming has been completed	9
6	 This is the automation	starts PAUSE	Let the time elapse during which the automation must remain open "PAUSE TIME"	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	Because the limit switch is connected you do not need to do anything because the limit switch itself gives the programming input	Let the time elapse during which the automation must remain open "PAUSE TIME"	This is the automation starts CLOSING	Press START to start closing	Let the time elapse during which the automation must remain open "PAUSE TIME"	Press START to start closing	The automation starts in CLOSING mode	On SLIDING, press START to define the point in which the automation is to slow down	For roll-up doors without LSC, press START to define the slowing down point.	The automation is in SLOW DOWN	Wait for the automation to stop automatically	Set the switch DIP1 to OFF to return to standard mode,		Time programming has been completed	10

5.1 Learning "START" OPENING COMMAND times

it is important to set up all LIMIT SWITCHES (LSO and LSC)

According to the security norms and for a proper use of the control panel

Learned (see "LEARNING REMOTE CONTROLS").

NECESSARY OF PEDESTRAIN COMMAND); it can also be connected from a transmitter which was previously
respective, START and PEDESTRAIN opening (see "CONNECTION OF OPENING COMMAND" AND "CON-
STRAIN commands. These commands can be used both from a device connected to terminals 9 - 16 or 9 - 17,
Below you will find the procedure to be used to learn times. To perform this operation, use the START and PEDE-
deceleration position for closing, activation or deactivation of the flashing light in pause mode.
circuit board is activated in times learning mode. In this mode it is possible to set: motor work and pause times,
position, set the switch DIP1 to ON and re-power the circuit board. Setting switch 1 (DIP1) to on the electronic
If the work times have been set, you must turn off the circuit board, set the automation in the closed
deceleration position for closing, activation or deactivation of the flashing light in pause mode.
circuit board is activated in times learning mode. In this mode it is possible to set: motor work and pause times,
position, set the switch DIP1 to ON and re-power the circuit board. Setting switch 1 (DIP1) to on the electronic
If the work times have been set, you must turn off the circuit board, set the automation in the closed
deceleration position for closing, activation or deactivation of the flashing light in pause mode.

The START and PED lights must be off. If, after being turned on, the motor starts again, it means that the
must flash while the inputs STOP, PHOTO, LSO, LSC, STOP, ALT must remain on (if the gate is closed the LSC is
When the electronic circuit board is turned on, if everything has been connected properly, the red TEST signal light
- if you don't need to assign any button to the PEDESTRAIN CHANNEL, don't follow the step no. 4 and wait for 8 seconds and one
flash of LED L1 until it flashes regularly.
- if you press the button of the remote control and LED L1 is lit on the remote control is not compatible
- if you press the button of the remote control in this control panel

Turning on and programming the unit

- You cannot cancel a single code in this control panel
- If you press the button of the remote control LED L1 flashes slowly it means that the memory is full
- If you don't need to assign any button to the PEDESTRAIN CHANNEL, don't follow the step no. 4 and wait for 8 seconds and one
flash of LED L1 until it flashes regularly.
- if you wish to learn a new remote control, repeat the operation from the first step.

1		Make sure that DIP switch 1 is set to OFF. The automation is in the CLOSED position
2		Press push-button P on the circuit board. LED L1 is lit on for 10 seconds waiting for a command
3		Press once and slowly release the remote control you wish to associate with the START command. The TEST light flashes 6 times fast then 1 slow flash and then remains lit on for 10 seconds.....(START Code learned!)
4		Press twice P, press and slowly release the wireless control key you wish to associate with the PEDESTRAIN command. LED L1 will flash 6 more times and then go off and return to their normal functions.

During the program, to avoid any interferences, we recommend to disconnect the antenna for
The remote control code can only be learned when the automation is CLOSED
a while from the terminal board no. 8-9.

4.3 Remote control LEARNING

 <p>Make sure that DIP switch 1 is set to OFF.</p> <p>The automation is in the CLOSED position.</p>	 <p>Press the push-button P on the circuit board and keep it pressed for 15 seconds until the TEST light starts flashing. The TEST light and the green START and PED lights go on. The TEST light starts flashing.</p>	 <p>After 15 seconds, release push-button P on the circuit board.</p> <p>Wait until the TEST light returns to normal flashing.</p>
--	---	---

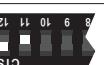

This operation deletes all codes in the memory. There is no arrangement for deleting single codes. The memory must be reset before learning the first remote control so that there are no previously learned codes and no unused codes in the system. The memory, and thus all the codes, can be deleted when the automation is closed.

4.1 DELETING the codes memory

ONE TIME WHILE WHEN THE ROLLING CODE IS COMPLETE THE L.E.D. FLASHES TWICE.
 LEARNING THE PARTIAL OPENING COMMAND. THE L.E.D. WITH PARTIAL ROLLING CODE WILL FLASH
 YOU CAN ACTIVATE OR DEACTIVATE THE COMPLETE ROLLING CODE FUNCTION. PRESS THE BUTTON WHEN YOU ARE

To manage remote controls, the electronic circuit board must have a wireless module. The electronic circuit board can handle several types of code, the first remote control learned determines the type and, as a result, it is not possible to learn remote controls with codes that differ from that of the first remote control learned. The codes that can be handled are the 12 to 64 bit standards and, for rolling HCS® type codes, only the fixed part but not the rolling counter control. The first transmitter learned determines the type of code that the receiver can handle; consequently the subsequent transmitters learned must have the same type of code.

4 Managing of REMOTE CONTROL

 <p>Exclusion of the slow down</p>	 <p>Higher slow down speed</p>	 <p>Medium slow down</p>	 <p>Very slow</p>
<p>the gates. For oil-hydraulic motor we suggest a higher speed.</p> <p>The speed of slow down is very slow and this is the most suitable for</p>	<p>Medium slow down</p>	<p>Medium slow-down</p>	<p>The speed of slow down is very slow and this is the most suitable for</p>

Using DIP 11-12 you can program the speed of slow down:

Operating logic for DIP			
2-ON	3-OFF	collective use	When open and in pause mode the unit does not accept commands; it closes automatically at the end of the pause time.
2-OFF	3-ON	semi automatic	Each command is followed by the open-stop-close-stop-open , etc... logic. Does not close automatically.
2-OFF	3-OFF	automatic 1	Each command invokes: open-close. It recloses automatically after pause time
2-ON	3-ON	automatic 2	Each command is followed by the open-stop-close-stop logic . Closes again automatically at the end of the pause time
ON	1 2 3 4	closes again when turned on	A complete opening, pause and closing cycle is run ONLY if the automation is in the open position at the moment the power supply is cut off.
ON	1 2 3 4	Flashing light also in pause mode	To activate this function follow the manual during the program of the working time (par. 5.1 Point no.4) in the terminal board no. 3 and 4 the power supply is available only when the motors are working or when they are in pause time.
ON	1 2 3 4	Courtesy light	The output of terminals 3 and 4 are powered from the onset of operating until 2 minutes after closing. It is, therefore useful to power the circuit until 2 minutes after closing.
Exclusion of the inputs STOP-FOTO-LSO-LSC of DIP 5-6-7-8:			
5-ON	7-ON	Exclude the input STOP	Exclude the input LSO (opening limit switch)
6-ON	8-ON	Exclude the input PHOTO	Exclude the input LSC (closing limit switch)
9-ON	10-ON	Pre-lighting	The pre-lighting will be deactivated and the inversion speed is increased
10-ON		Interior Brake	The interior brake will be activated from the inversion of the LSC

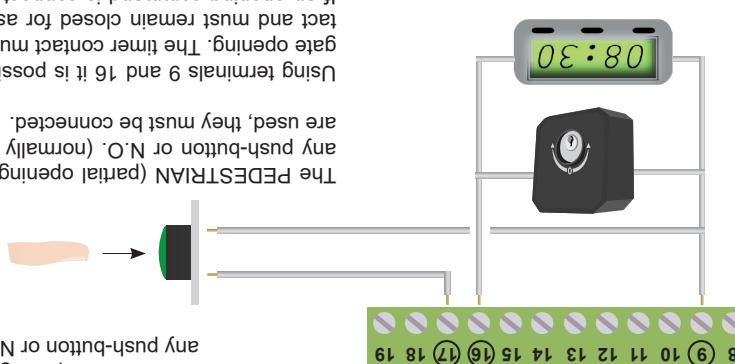

Normally the green lights on the control inputs **STOP - PHOTO - LSO - LSC - START - PED - ALT** are ON
normally the red lights on inputs **STOP - PHOTO - LSO - LSC - START - PED - ALT** are OFF

The TEST light signals that the internal logic is functioning correctly. It must flash at one second intervals indicating that the internal microprocessor is on and awaiting a command. When the control unit is powered, the warning lights, set on the inputs, are ON when the contacts on the inputs are closed toward the common:

2.14 Checking connections

Using terminals 9 and 16 it is possible to connect a TIMER to program gate opening. The timer contact must be an N.O. (normally open) contact and must remain closed for as long as the gate remains open. If an opening command is connected to terminal 16, it must be connected in parallel.

The PEDESTRAIN (partial opening command) can be connected to any push-button or N.O. (normally open) contact. If several devices are used, they must be connected in parallel.

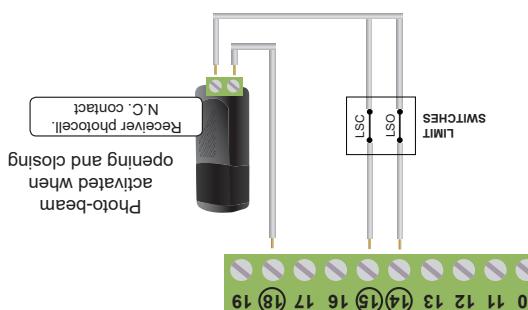

The START opening command can be connected to any push-button or N.O. (normally open) contact.

2.13 Connection of the "START" and "PEDESTRAIN" commands

WARNING: If the installed photocell must be working during opening and closing, the DIP 7 and 8 must be in the OFF position.

Photocells activated when opening and closing must be installed photocell positioned so that the beam is activated during opening and closing.

2.12 Connection of the PHOTOCELLS both in closing and opening

After the TEST function is completed, memorize the working time for the START control during this time the control unit checks the devices which should be connected to the TEST.

The TEST function is compatible with lower devices (for example TRANSCEIVER) so the gate can have a delay when opening. The TEST can be done also from some devices in the INPUT COSTA (safety edge) and STOP.

The TEST function is compatible with lower devices (for example TRANSCEIVER) so the gate can have a delay when opening. The TEST can be done also from some devices in the INPUT COSTA (safety edge) and STOP.

If more than one pair of photo-cells is used, they must be connected in series.

(Normally closed)

- dry - type N.C.

(Insulated from power supply)

tacat must be:

The photo-cell receiver con-

tact must be:

lighs on for 5 seconds and the automation does not start.

each opens if there is a photocell malfunction, the control unit turns the test before each opening. In fact, the control unit performs the test before each opening.

The photo-cell TEST ensures that the automation only functions when the photo-cells are functioning properly. In fact, the control unit performs the test before each opens if there is a photocell malfunction, the control unit turns the test before each opening. If you wish to return to the LIGHT function on terminals 20 and 21, the photocells must be connected without the test function and then you must repeat the times learning operation with the START com-

The control unit automatically activates the test only after the START com-

mand times have been learned. If you wish to return to the LIGHT function

on terminals 20 and 21, the photocells must be connected without the test function and then you must repeat the times learning operation with the START com-

mand times have been learned. If you wish to return to the LIGHT function

mand times have been learned. If you wish to return to the LIGHT function

on terminals 20 and 21, the photocells must be connected without the test function and then you must repeat the times learning operation with the START com-

mand times have been learned. If you wish to return to the LIGHT function

2.11 Connection of the 24 VDC photocell

2.10 Connection of the 24 VAC photocell

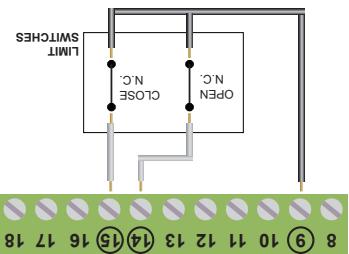

2.9 Connection of the MAGNETIC LIMIT SWITCHES

The limit switch contacts
must be N.C.
(normally closed) contacts.

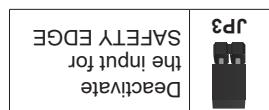

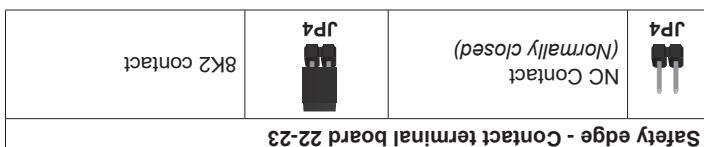

The picture shows the connection of both limit switches, however, on
this control unit they can also be used separately. Therefore, it is pos-
sible to use just the "Open limit switch" or just the "Close limit switch".

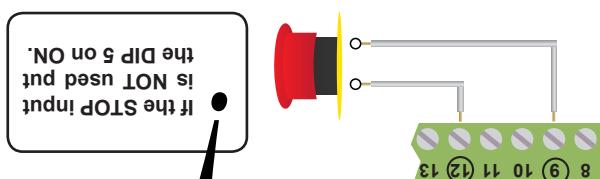

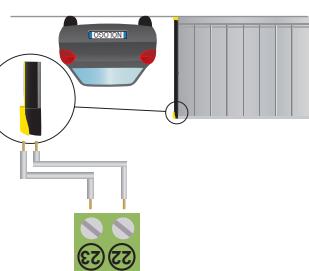

2.8 Connection of LIMIT SWITCHES LSO and LSC

Connection of the safety devices requires the use of any push-button or N.C. (normally closed contact). When there are several safety devices, they are connected in series.

SAFE EDGE input is in Stand-by or has been excluded.
If LED L1 flashes but it doesn't turn off completely it means that the

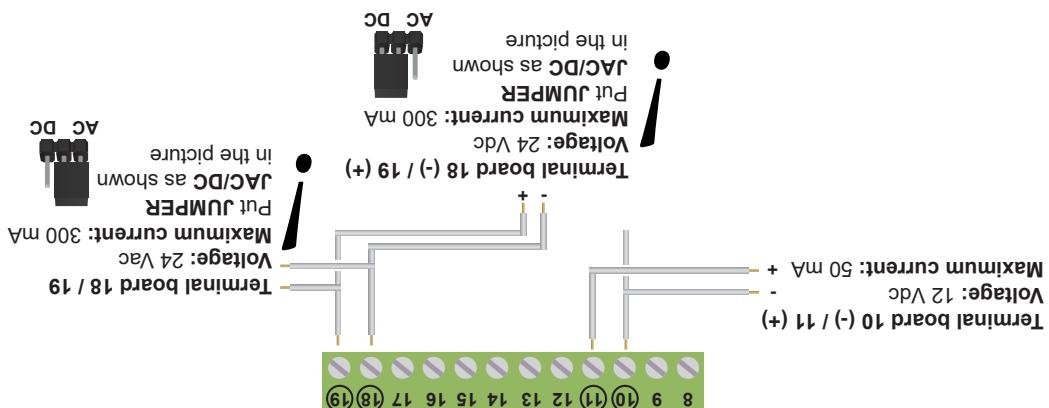

Stops the automation and activates an inver-
sion of direction for approximately 1.5 seconds.

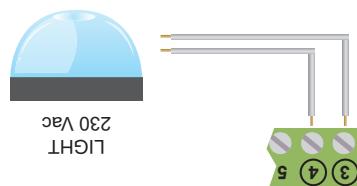

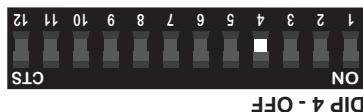

2.7 Connection of the STOP/ALT control devices

Push-button: stops and temporarily prevents all
control unit functions until it is pressed again.
Switch: keeps the automation unit blocked until it is
reset.

Connection of the STOP control

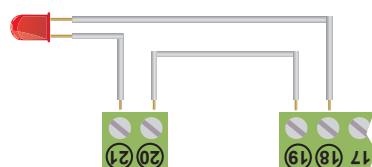

2.6 Power supply of the ACCESSORIES

2.5 Connection of the COURTESY light

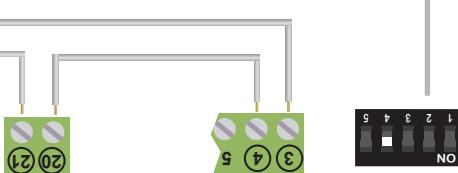

If you plan to use the photocells test, or a 24V light, this connection cannot be used.

2.4 Connection of one 24V gate open and moving LIGHT

If you plan to use the photocells test, or a 24V light, this connection cannot be used.

Signal light complete without intermediate circuit board

2.2 Description of the electrical connection

To be sure that the opening is really "opening", try to block the gate photocells: if the gate begins to close, the connection is incorrect and the motor OPEN and CLOSE wires must be inverted.

When in doubt as to the correct connection, if possible, manually position the automation at the midpoint of its stroke. Be ready to stop the system using the STOP control!

the OPEN and CLOSE poles.
Pay particular attention not to invert

Connection of the MOTOR

pair of 5A fuses.

A differential switch is recommended but not indispensable if one is already installed on the plant.

230 Volt Single-phase ultimate current. The control unit always be protected with a magnetic thermal switch or a pair of 5A fuses.

Dimensions	87 x 126 x 40 mm		
Weight	0.46 kg		
HP	1		
W	750		
A	4		
MAX power of signal light 230 Vac	40 W		
MAX absorption with clean contact	2 A		
MAX absorption 24 Vac/dc	300 mA		
MAX absorption 12 Vdc	50 mA		

1.4 Technical features

We recommend to install a STOP switch which stops immediately the gate. The switch has a normally close contact which opens the contact when it is working. See Par. 2.7.

Application on sliding automation Application on swinging automation

These two simple diagrams show only one of the possible applications for this control unit. The risks inherent to the "MACHINE" and the user's responsibilities must be analyzed in depth in order to establish how many elements need to be installed. All photocells have a system of synchronization that makes it possible to eliminate interference between two pairs of photocells (for other details, see the instructions for the photocells). In the diagram, the pair of photocells "Photo A" (connected in this control unit) has no effect during opening while it causes a total inversion during closing. "Photo B" is connected in series to "Photo A".

1.3 Type of installation

The START-S3XL/2018 electronic control unit is used to control the movement of entrances, swinging gatesways, rolling gates and automatic doors. It can be connected to a hydraulic or electromechanical actuator equipped with an asynchronous, single-phase motor operating at a voltage of 230 Vac.

1.2 Field of application

Every programming and/or every maintenance service should be done by qualified technicians.

Using the unit improperly and performing repairs or modifications personally will void the warranty. The producer declines any responsibility for damages due to inappropriate use of the product and due to any use other than the use the product was designed for. The producer declines any responsibility for consequential damages except civil liability for the products.

Radio receiver

START-S3XL/2018

- Universal control unit for 1 sliding gate or up-and-over door.
- Motor, limit switches of slow down. Inputs: start-timer- clock, photocell during closing, limit switch during opening and closing, partial opening, stop.
- Time acquisition "real-time".
